PERSPECTIVES IN REHABILITATION

Young adults with intellectual disability transitioning from school to post-school: A literature review framed within the ICF

Purpose: The purpose of this review was to describe literature relating to transition for young people with an intellectual disability and identify gaps within the current knowledge base. **Method:** A narrative literature review was undertaken. Searches of databases Medline, CINAHL, PsycINFO, ERIC, ISI Web of Science and ProQuest 500 International provided relevant research articles. The search terms used were intellectual disability, transition, employment, and ICF as well as other terms derived from the ICF. Manual searches of reference lists identified additional studies. Furthermore, government websites were searched for relevant reports and policies. **Results:** Transition literature was explored by ICF domains: body functions and structures, activity and participation and contextual factors. Studies were identified in some but not all areas and included literature describing self-determination and participation in leisure activities; for those with mild intellectual disability. However, significant gaps were found particularly for those with severe intellectual disability. **Conclusions:** The ICF is a useful tool in framing a review of transition literature for young people with intellectual disability due to the complexity and multi-faceted nature of transition. The important influence of environmental factors including family systems, post-school services and access to transport were highlighted as having considerable impacts on transition outcomes. **Keywords:** Transition, intellectual disability, school, ICF, employment

Introduction

The term transition has been commonly used to describe the crucial task of moving from the protected life of a child to the autonomous and independent life of an adult. Individuals vary substantially in their experiences and the rate at which their transition. The transition of adolescents with an

Implications for Rehabilitation

- The ICF is a useful tool in framing transition research to identify gaps.
- The current body of literature in transition from school for young adults with intellectual disabilities is too singularly focused and rarely considers those with moderate to severe intellectual disability.
- There has been little research on this topic in low and middle income countries.
- The scale of the impact of environmental factors on young people transitioning from school to post-school is currently under-represented.
- A holistic approach to post-school outcomes needs to be undertaken in future research.

intellectual disability is characterised by wider scope, longer duration, and attenuated experiences than for those without an intellectual disability [1-3]. Transition has been reported by families and caregivers as a time of upheaval, stress and important decisions, and there is much confusion about services available [4]. Challenges which research into transition is yet to overcome include the bias towards people with mild intellectual disability, accurately describing the psychological experience of transition, and the strong focus on employment and autonomy alone [5]. Exploring and facilitating the complex and multi-faceted transition process for young people with intellectual disabilities has now become an important concern internationally for service providers and researchers working within this area.

The International Classification of Functioning, Disability and Health (ICF) presents a framework that provides a scientific basis and standardised language for describing and classifying health domains, health-related
