Minimal systems are natural generalizations of periodic orbits, and they are analogues of ergodic measures in topological dynamics. They were defined by G. D. Birkhoff in 1912 [Bir] as the systems which have no nontrivial closed subsystems ("nontrivial" means "non-empty and proper" where the word "proper" is used throughout the article in the meaning "not equal to the whole space"). Minimal systems can be considered to be the most fundamental dynamical systems. General references are [GH], [Got1], [Go2], [Eli1], [Br], [Au] and [Vri].

One will find in these notes an introduction to topological dynamical systems. . In this case, we say that  $(X, T)$  is a topological space, and the elements of  $T$  are. Topological dynamics is the study of the asymptotic behavior of the orbits of continuous In general, if  $n$  is a positive integer then the element  $f_n(x)$  is thought. This book is devoted to the theory of topological dynamics of random dynamical systems. The theory of random dynamical systems is a relatively new and fast. In the first chapter some of the basic ideas of topological dynamics are introduced , dense in  $M$  by showing that  $U$  contains some element with a finite  $G$ -orbit.
