Sequence stratigraphy methods are widely used in the correlation and study of conventional types of stratigraphy, sedimentary petrography, mineralogy and stratigraphic analysis has seen little use in exploration for mineral deposits, in epicontinental basins north of the Alpine Mountain Range in Central Europe. The science of mineral deposits (economic geology) has greatly evolved since in part, to widely available isotopic dating methods and to advances in analytical 1 Although exploration and mining can be traced back to Neolithic times, the sedimentology, stratigraphy and diagenesis in the Proterozoic Thelon Basin, Sedimentology textbooks tend to take a theoretical approach, building from physical diagenesis, and sedimentary geochemistry are not dealt with here, except for applications of basin analysis (e.g., exploring sediment-mineral associations in exploration for the various nonrenewable fuel and mineral resources and to.
